

2-(3,4-DIMETHYLPHENYL)-4-{[2-HYDROXY-3'-(1H-TETRAZOL-5-YL)BIPHENYL-3-YL]-HYDRAZONO}-5-METHYL-2,4-DIHYDROPYRAZOL-3-ONE  
CHOLINE

5 This invention relates to an improved thrombopoietin (hereinafter TPO) mimetic, the choline salt of 2-(3,4-dimethylphenyl)-4-{[2-hydroxy-3'-(1H-tetrazol-5-yl)biphenyl-3-yl]-hydrazono}-5-methyl-2,4-dihydropyrazol-3-one. The compound is represented by Structure I:

10

(I)

The compound of this invention is useful as an agonist of the TPO receptor, particularly in enhancing platelet production.

Detailed Description of the Invention

15 2-(3,4-dimethylphenyl)-4-{[2-hydroxy-3'-(1H-tetrazol-5-yl)biphenyl-3-yl]-hydrazono}-5-methyl-2,4-dihydropyrazol-3-one is a compound which is disclosed and claimed, along with pharmaceutically acceptable salts, hydrates, solvates and esters thereof, as being useful as an agonist of the TPO receptor, particularly in enhancing platelet production and particularly in the treatment of thrombocytopenia, in

20 International Application No. PCT/US01/16863, having an International filing date of May 24, 2001; International Publication Number WO 01/89457 and an International Publication date of November 29, 2001 (compound of Example 12), the entire disclosure of which is hereby incorporated by reference. International Application No. PCT/US01/16863 does not specifically disclose a salt form for any of the

25 compounds disclosed therein.

It has now surprisingly been found that the choline salt of 2-(3,4-dimethylphenyl)-4-[[2-hydroxy-3'-(1H-tetrazol-5-yl)biphenyl-3-yl]hydrazone]-5-methyl-2,4-dihydropyrazol-3-one has numerous advantages over the free acid. The free acid is poorly soluble in water. This poor solubility adversely affects the ability of 5 the free acid to be formulated into pharmaceutical dosage forms and reduces the bioavailability and oral exposure of the compound *in vivo*.

While the free acid is highly useful as an agonist of the TPO receptor, particularly in enhancing platelet production and particularly in the treatment of thrombocytopenia, the choline salt of 2-(3,4-dimethylphenyl)-4-[[2-hydroxy-3'-(1H-tetrazol-5-yl)biphenyl-3-yl]hydrazone]-5-methyl-2,4-dihydropyrazol-3-one has the 10 added advantages of enhanced bioavailability and oral exposure.

The compound of this invention, 2-(3,4-dimethylphenyl)-4-[[2-hydroxy-3'-(1H-tetrazol-5-yl)biphenyl-3-yl]hydrazone]-5-methyl-2,4-dihydropyrazol-3-one choline (hereinafter - "Active Ingredient" or "Compound A"), is useful as an agonist of the 15 TPO receptor, particularly in enhancing platelet production and particularly in the treatment of thrombocytopenia. The Active Ingredient can be administered in a conventional dosage form prepared by combining the Active Ingredient with a conventional pharmaceutically acceptable carrier or diluent according to techniques readily known to those of skill in the art, such as those described in International 20 Application No. PCT/US01/16863.

Suitably, the present invention includes within its scope pharmaceutical compositions comprising 2-(3,4-dimethylphenyl)-4-[[2-hydroxy-3'-(1H-tetrazol-5-yl)biphenyl-3-yl]hydrazone]-5-methyl-2,4-dihydropyrazol-3-one choline, as the Active Ingredient, in association with a pharmaceutically acceptable carrier or diluent. 25 Compound A of this invention can be administered by oral, parenteral, intradermal or topical routes of administration. The term parenteral as used herein includes intravenous, intramuscular, subcutaneous, intranasal, intrarectal, intravaginal and intraperitoneal administration. Oral administration is generally preferred. Compound A can be formulated in dosage forms appropriate for each route of administration 30 including capsules, tablets, pills, powders and granules. In such solid dosage forms, the active compound is generally admixed with at least one inert diluent. The oral dosage forms can also comprise, as is normal practice, additional substances other than inert diluents, e.g., lubricating agents, glidants and antioxidants. In the case of capsules, tablets and pills, the dosage forms may also comprise buffering agents. 35 Tablets and pills can additionally be prepared for a sustained release.

Preparations according to this invention for parenteral administration include sterile aqueous solutions although nonaqueous suspensions of emulsions can be

employed. Such dosage forms may also contain adjuvants such as preserving, wetting, osmotic, buffering, emulsifying and dispersing agents. They may be sterilized by, for example, filtration through a bacteria retaining filter, by incorporating sterilizing agents into the compositions, irradiating the compositions or by heating the 5 compositions.

As used herein "choline" means (2-hydroxyethyl)trimethylammonium.

Doses of the presently invented Active Ingredient in a pharmaceutical dosage unit as described above will be an efficacious, nontoxic quantity preferably selected from the range of 0.001 - 100 mg/kg of total body weight, preferably 0.001 - 50 10 mg/kg. When treating a human patient in need of a TPO mimetic, the selected dose is preferably administered from 1-6 times daily, orally or parenterally. Preferred forms of parenteral administration include topically, rectally, transdermally, by injection and continuously by infusion. Oral dosage units for human administration preferably contain from 0.05 to 3500 mg of Active Ingredient, most preferably from 15 0.5 to 1,000 mg of Active Ingredient. Oral administration, which uses lower dosages is preferred. Parenteral administration, at high dosages, however, also can be used when safe and convenient for the patient. The above dosages relate to the preferred amount of the Active Ingredient expressed as the free acid.

It will be recognized by one of skill in the art that the optimal quantity and 20 spacing of individual dosages of the Active Ingredient will be determined by the nature and extent of the condition being treated, the form, route and site of administration, and the particular patient being treated, and that such optimums can be determined by conventional techniques. It will also be appreciated by one of skill in the art that the optimal course of treatment, i.e., the number of doses of the Active 25 Ingredient given per day for a defined number of days, can be ascertained by those skilled in the art using conventional course of treatment determination tests.

Generally speaking, the compound of this invention is prepared by dissolving the free acid, 2-(3,4-dimethylphenyl)-4-{{[2-hydroxy-3'-(1H-tetrazol-5-yl)biphenyl-3-yl]hydrazono}-5-methyl-2,4-dihydropyrazol-3-one, in an appropriate organic solvent, 30 such as a mixture of ethanol and ethyl acetate, filtering the resultant mixture to remove contaminants, then adding this solution to a solution of, for example, 1.5 equivalents of choline hydroxide in an organic solvent, preferably a water-miscible solvent, such as MeOH or THF. The compound of this invention is precipitated out, generally over 3 to 24 hours, then is filtered off and dried, for example, dried in vacuo 35 or air dried at an elevated temperature.

Choline hydroxide 50 wt. % solution in methanol, was purchased from the Aldrich Chemical Company, Milwaukee, Wisconsin.

Organic solvents are available from the Aldrich Chemical Company, Milwaukee, Wisconsin.

Because the pharmaceutically active compound of the present invention is active as a TPO mimetic it exhibits therapeutic utility in treating thrombocytopenia and other conditions with depressed platelet production.

The treatment of thrombocytopenia, as described herein, is accomplished by increasing the production of platelets.

By the term "thrombocytopenia" and derivatives thereof as used herein is to be broadly interpreted as any decrease in the number of blood platelets below what is considered normal or desired for a healthy individual. Thrombocytopenia is known to have many causative factors, including but not limited to, radiation therapy, chemotherapy, immune therapy, immune thrombocytopenic purpura (ITP, Bussel J. B., Seminars in Hematology, 2000, 37, Suppl 1, 1-49), myelodysplastic syndrome (MDS), aplastic anemia, AML, CML, viral infections (including, but not limited to; HIV, hepatitis C, parvovirus) liver disease, myeloablation, bone marrow transplant, stem cell transplant, peripheral blood stem cell transplant, progenitor cell defect, polymorphisms in stem cells and progenitor cells, defects in Tpo, neutropenia (Sawai, N. J. Leukocyte Biol., 2000, 68, 137-43), dendritic cell mobilization (Kuter D. J. Seminars in Hematology, 2000, 37, Suppl 4, 41-49), proliferation, activation or differentiation. The pharmaceutically active compound of this invention is useful in treating thrombocytopenia regardless of the factor or factors causing the condition. The pharmaceutically active compound of this invention is also useful in treating thrombocytopenia when the causative factor or factors of the condition are unknown or have yet to be identified.

TPO has been demonstrated to act as a mobilizer of stem cells into the peripheral blood (Neumann T. A. et al., Cytokines, Cell. & Mol. Ther., 2000, 6, 47-56). This activity can synergize with stem cell mobilizers such as G-CSF (Somolo et al., Blood, 1999, 93, 2798-2806). The compound of the present invention is thus useful in increasing the numbers of stem cells in circulation in donors prior to leukapheresis for hematopoietic stem-cell transplantation in patients receiving myeloablative chemotherapy.

Likewise, TPO stimulates growth of myeloid cells, particularly those of granulocyte/macrophage lineage (Holly et al., US-5989537). Granulocyte/macrophage progenitors are cells of the myeloid lineage that mature as neutrophils, monocytes, basophils and eosinophils. The compound of the present invention thus has therapeutic utility in stimulating the proliferation of neutrophils in patients with neutropenic conditions.

Prophylactic use of the compound of this invention is contemplated whenever a decrease in blood or blood platelets is anticipated. Prophylactic use of Compound A results in a build up of platelets or a commencement of platelet production prior to an anticipated loss of blood or blood platelets. Prophylactic uses of Compound A 5 includes but is not limited to transplant surgery, surgery, anesthesia prior to child birth and gut protection.

Human dendritic cells have been shown to express the TPO receptor (Kumamoto et al., *Br. J. Haem.*, 1999, 105, 1025-1033) and TPO is a potent mobilizer of dendritic cells. The TPO mimetic compound of the current invention is also useful 10 as a vaccine adjuvant in that it increases the activity and mobility of dendritic cells. Compound A is useful as an immunological adjuvant, given in combination with an orally, transdermally or subcutaneously delivered vaccine and/or immunomodulator, by increasing the activity and mobility of dendritic cells.

TPO is known to have various effects including anti-apoptotic/survival effects 15 on megakaryocytes, platelets and stem cells, and proliferative effects on stem cells and megakaryocytic cells (Kuter D. J. *Seminars in Hematology*, 2000, 37, 41-9). These TPO activities effectively increase the number of stem and progenitor cells so that there are synergistic effects when TPO is used in conjunction with other cytokines that induce differentiation.

20 A further aspect of the invention provides for a method of treating degenerative diseases in a mammal, including a human, in need thereof which comprises administering to such mammal a therapeutically effective amount of presently invented Compound A.

By the term degenerative disease, and derivatives thereof, as used herein is 25 meant a disease state selected from: nervous system disorders, including transverse myelitis, multiple sclerosis, demyelination occurring after trauma to the brain or spinal cord, acute brain injury, head trauma, peripheral nerve injury, ischaemic brain injury, spinal cord injury, hereditary myelin disorder of the CNS, epilepsy, perinatal asphyxia, asphyxia, anoxia, status epilepticus, and stroke; neurodegenerative 30 diseases such as Alzheimer's disease, Parkinson disease, Huntington's disease, and amyotrophic lateral sclerosis; in the treatment, repair and/or regeneration of tissue, for example: in cardiovascular disorders, myocardial infarction and cardiovascular disease/tissue, and in the treatment, repair and/or regeneration of liver disease/tissue, gastrointestinal disease/tissue and kidney disease/tissue; in the 35 treatment of AIDS; and in the treatment of diabetes/diabetes mellitus.

Stroke refers to a cerebral vascular incident (CVI) and includes acute thromboembolic stroke. Stroke includes both focal and global ischemia. Also

included are transient cerebral ischemic attacks and other cerebral vascular problems accompanied by cerebral ischemia. A patient undergoing carotid endarterectomy specifically or other cerebrovascular or vascular surgical procedures in general, or diagnostic vascular procedures including cerebral angiography and the like.

Other incidents are head trauma, spinal cord trauma, or injury from general anoxia, hypoxia, hypoglycemia, hypotension, as well as similar injuries seen during procedures from embolus, hyperfusion, and hypoxia.

Compound A is useful in a range of incidents, for example, during cardiac bypass surgery, in incidents of intracranial hemorrhage, in perinatal asphyxia, in cardiac arrest, and status epilepticus.

The present invention therefore provides a method of treating a disease state selected from: nervous system disorders, including transverse myelitis, multiple sclerosis, demyelination occurring after trauma to the brain or spinal cord, acute brain injury, head trauma, spinal cord injury, peripheral nerve injury, ischaemic brain injury, hereditary myelin disorder of the CNS, epilepsy, perinatal asphyxia, asphyxia, anoxia, status epilepticus, and stroke; neurodegenerative diseases such as Alzheimer's disease, Parkinson disease, Huntington's disease, and amyotrophic lateral sclerosis; in the treatment, repair and/or regeneration of tissue, for example: in cardiovascular disorders, myocardial infarction and cardiovascular disease/tissue, and in the treatment, repair and/or regeneration of liver disease/tissue, gastrointestinal disease/tissue and kidney disease/tissue; in the treatment of AIDS; and in the treatment of diabetes/diabetes mellitus which comprises the administration an effective amount of Compound A.

The treatment of degenerative diseases, as described herein, is accomplished by the administration of Compound A and is not limited to any particular mechanism of action. A mechanism of action for treating the degenerative diseases, as described herein, is by stimulating the survival and/or production of stem cells and/or increasing stem cell function and/or longevity.

Degenerative diseases are known to have many causative factors, including but not limited to, viral infections (including, but not limited to; HIV, hepatitis C, parvovirus) and liver disease, aging, auto immune diseases, neural disease/damage, liver disease/damage, kidney disease/damage, gastrointestinal disease/damage, cardiovascular disease/damage and pancreatic disease/damage. This invention relates to the treatment of degenerative diseases regardless of the factor or factors causing the condition. The compound of this invention, Compound A, is also useful

in treating degenerative diseases when the causative factor or factors of the condition are unknown or have yet to be identified.

5 A skilled physician will be able to determine the appropriate situation in which subjects are susceptible to or at risk of a degenerative disease, for example, stroke as well as suffering from stroke for administration by methods of the present invention.

Prophylactic use of the compounds of this invention is contemplated whenever a degenerative disease is anticipated.

10 The ability of Compound A to treat degenerative diseases is demonstrated by activity in the CD34+ Progenitor Cell Proliferation Assay.

CD34+ Progenitor Cell Proliferation Assay

15 Compound A is tested for its ability in stimulating the survival and proliferation of early CD34+ progenitor cells from human bone marrow. In this assay, purified human CD34+ progenitor cells are incubated in liquid culture with Compound A for up to 7 days and the number of cells expressing the early stem cell marker CD34 is then measured by flow cytometry and compared to untreated cells (see Liu et al. *Bone Marrow Transplantation*. 24:247-52, 1999).

20 The present invention therefore provides a method of treating degenerative diseases, which comprises the administration an effective amount of Compound A to a subject in need thereof. Compound A provides for a method for treating the above indicated disease states because of its ability to treat degenerative diseases.

25 It is part of this discovery that the in vivo administration of Compound A is useful in treating Parkinson's disease, Huntington's disease, multiple sclerosis and ischaemic brain injury. Stem cells, including adult bone marrow stem cells are indicated as effective in treating multiple sclerosis; Stangel M. et al., Progress in Neurobiology, 68(5): 361-76, 2002 Dec. Neural stem cells and their use in Parkinson's disease, Huntington's disease, multiple sclerosis and ischaemic brain 30 injury is described in Ostenfeld T. et al., Advances & Technical standards in Neurosurgery, 28: 3-89, 2003.

35 Further, it is part of this discovery that the in vivo administration of Compound A is useful in the regeneration and repair of tissues that respond to stem cell treatment. Such tissues are readily known or readily ascertainable by those skilled in the art. For example, stem cells are indicated as being useful in treating patients with myocardial infarction, cardiovascular disorders and cardiovascular disease; Stamm C. et al., Lancet. 361(9351): 45-6, 2003 and Semsarian C., Internal Medicine

Journal, 32(5-6): 259-65, 2002. Stem cells are indicated in treating, repairing and/or in the regeneration of liver disease/tissue, gastrointestinal disease/tissue and kidney disease/tissue; Choi D. et al., Cell transplantation, 11(4): 359-68, 2002, Poulsom R. et al., Journal of Pathology, 197 (4): 441-56, 2002 and Alison M. et al., Journal of Pathology, 197 (4): 419-23, 2002.

5 Further, it is part of this discovery that the in vivo administration of Compound A is useful in the treatment of diabetes/diabetes mellitus. Stem cells are indicated in treating diabetes, Berna G, et al., Biomedicine & Pharmacotherapy, 55(4): 206-12, 2001 and Beilhack GF., et al., Diabetes, 52(1):59-68, 2003.

10 A further aspect of the invention provides for methods of co-administering the presently invented Compound A with further active ingredients, such as other compounds known to treat degenerative diseases and/or thrombocytopenia, including chemotherapy-induced thrombocytopenia and bone marrow transplantation and other conditions with depressed platelet production, or compounds known to 15 have utility when used in combination with a TPO mimetic.

By the term "co-administering" and derivatives thereof as used herein is meant either simultaneous administration or any manner of separate sequential administration of Compound A, and a further active ingredient or ingredients, known to treat degenerative diseases and/or thrombocytopenia, including chemotherapy-20 induced thrombocytopenia and bone marrow transplantation and other conditions with depressed platelet production. The term further active ingredient or ingredients, as used herein, includes any compound or therapeutic agent known to have or that demonstrates advantageous properties when administered with TPO or a TPO mimetic. Preferably, if the administration is not simultaneous, the compounds are 25 administered in a close time proximity to each other. Furthermore, it does not matter if the compounds are administered in the same dosage form, e.g. one compound may be administered topically and another compound may be administered orally.

The TPO mimetic compound of the current invention is also useful in acting 30 on cells for survival or proliferation in conjunction with other agents known to act on cells for survival or proliferation. Such other agents include but are not limited to: G-CSF, GM-CSF, TPO, M-CSF, EPO, Gro-beta, IL-11, SCF, FLT3 ligand, LIF, IL-3, IL-6, IL-1, Progenipoitin, NESP, SD-01, or IL-5 or a biologically active derivative of any of the aforementioned agents, KT6352 (Shiotsu Y. et al., Exp. Hemat., 1998, 26, 1195-1201), uteroferrin (Laurenz JC., et al. Comp. Biochem. & Phys., Part A, 35 Physiology, 1997, 116, 369-77), FK23 (Hasegawa T., et al. Int. J. Immunopharm., 1996, 18 103-112) and other molecules identified as having anti-apoptotic, survival

or proliferative properties for stem cells, progenitor cells, or other cells expressing Tpo Receptors.

Examples of a further active ingredient or ingredients for use in combination with the presently invented Compound A include but are not limited to:

5 chemoprotective or myeloprotective agents such as G-CSF, BB10010 (Clemons et al., Breast Cancer Res. Treatment, 1999, 57, 127), amifostine (Ethylol) (Fetscher et al., Current Opinion in Hemat., 2000, 7, 255-60), SCF, IL-11, MCP-4, IL-1-beta, AcSDKP (Gaudron et al., Stem Cells, 1999, 17, 100-6), TNF-a, TGF-b, MIP-1a (Egger et al., Bone Marrow Transpl., 1998, 22 (Suppl. 2), 34-35), and other  
10 molecules identified as having anti-apoptotic, survival or proliferative properties.

Additional examples of a further active ingredient or ingredients for use in combination with the presently invented TPO mimetic compound includes but is not limited to: stem cell, megakaryocyte, neutrophil mobilizers such as chemotherapeutic agents (i.e., cytoxan, etoposide, cisplatin, Ballestrero A. et al., Oncology, 2000, 59, 15 7-13), chemokines, IL-8, Gro-beta (King, A. G. et al. J. Immun., 2000, 164, 3774-82), receptor agonist or antagonist antibodies, small molecule cytokine or receptor agonists or antagonists, SCF, Flt3 ligand, adhesion molecule inhibitors or antibodies such as: anti-VLA-4 (Kikuta T. et al., Exp. Hemat., 2000, 28, 311-7) or anti-CD44 (Vermeulen M. et al., Blood, 1998, 92, 894-900), cytokine/chemokine/interleukin or  
20 receptor agonist or antagonist antibodies, MCP-4 (Berkhout TA., et al., J. Biol. Chem., 1997, 272, 16404-16413; Uguccioni M. et al., J. Exp. Med., 1996, 183, 2379-2384).

Compound A of this invention is useful as a TPO mimetic in mammals, particularly humans, in need thereof.

25 The method of this invention of inducing TPO mimetic activity in mammals, including humans, comprises administering to a subject in need of such activity an effective TPO mimetic amount of Compound A of the present invention.

The invention also provides for the use of Compound A in the manufacture of a medicament for use in therapy.

30 The invention also provides for the use of Compound A in the manufacture of a medicament for use as a TPO mimetic.

The invention also provides for the use of Compound A in the manufacture of a medicament for use in enhancing platelet production.

35 The invention also provides for the use of Compound A in the manufacture of a medicament for use in treating thrombocytopenia.

The invention also provides for the use of Compound A in the manufacture of a medicament for use in the treatment of degenerative diseases.

The invention also provides for a pharmaceutical composition for use in the treatment of degenerative diseases which comprises Compound A and a pharmaceutically acceptable carrier.

5 The invention also provides for a pharmaceutical composition for use as a TPO mimetic which comprises Compound A and a pharmaceutically acceptable carrier.

The invention also provides for a pharmaceutical composition for use in the treatment of thrombocytopenia which comprises Compound A and a pharmaceutically acceptable carrier.

10 The invention also provides for a pharmaceutical composition for use in enhancing platelet production which comprises Compound A and a pharmaceutically acceptable carrier.

The invention also provides for a pharmaceutical composition for use in treating degenerative diseases which comprises Compound A and a pharmaceutically acceptable carrier.

15 By the term "treating" and derivatives thereof as used herein, is meant prophylactic and therapeutic therapy.

20 All publications, including but not limited to patents and patent applications, cited in this specification are herein incorporated by reference as though fully set forth.

No unacceptable toxicological effects are expected when the compound of the invention is administered in accordance with the present invention.

25 Contemplated Equivalents – It will be appreciated by the person of ordinary skill in the art that Compound A may also exist in tautomeric forms. Tautomeric forms of Compound A may include, but are not limited to, structures formally represented by the following formulae (II and III).

(II)

(III).

All such compounds are included in the scope of the invention and inherently included in the definition of Compound A.

5

The following examples further illustrate the present invention. The examples are not intended to limit the scope of the invention as defined hereinabove and as claimed below.

10

### EXAMPLE 1

Preparation of:

2-(3,4-dimethylphenyl)-4-{{[2-hydroxy-3'-(1H-tetrazol-5-yl)biphenyl-3-yl]-hydrazone}-5-methyl-2,4-dihydropyrazol-3-one choline

15

2-(3,4-Dimethylphenyl)-4-[[2-hydroxy-3'-(1H-tetrazol-5-yl)biphenyl-3-yl]-hydrazone}-5-methyl-2,4-dihdropyrazol-3-one, 1.1 g of crude orange solid, in 7 mL of ethyl acetate and 12 mL of ethanol (190 proof) was stirred at approximately 40°C. To this suspension 2.5 ml of choline hydroxide (1N) solution in methanol was added resulting in a dark orange brown solution. Water (1 ml) was added to the dark solution and the mixture stirred at approx. 35 °C for approx. 3 hours. During this time, precipitation was seen in the solution. The suspension was stirred for another 10 72 hours at approx. 20 °C, and then the solid was isolated by filtration and dried at approx. 40 °C over 12 hours to yield 1.2 gram (87% yield) of the title compound as a crystalline solid with a light orange color.

15 The solid was proved to be crystalline by X-ray powder diffraction taken on a Philips X'Pert Pro diffractometer. The sample was scanned with the following parameters: scan range: 2-35 degrees two-theta; generator power: 40kV, 40mA; radiation source: Cu K $\alpha$ ; scan type: continuous; step time: 10.16 seconds; step size: 0.0167 degrees two-theta per step; sample rotation: 25 rpm. Following are the X-ray powder pattern and peak list.

DSC data showed the solid melts with decomposition with an endotherm onset at about 235.3 °C.

EXAMPLE 2

## Preparation of:

2-(3,4-dimethylphenyl)-4-{[2-hydroxy-3'-(1H-tetrazol-5-yl)biphenyl-3-yl]-hydrazone}-5-methyl-2,4-dihydropyrazol-3-one choline

5

2-(3,4-Dimethylphenyl)-4-{[2-hydroxy-3'-(1H-tetrazol-5-yl)biphenyl-3-yl]-hydrazone}-5-methyl-2,4-dihydropyrazol-3-one (2.0g, 4.29 mmole) was suspended in ethanol (17 ml) and water (1.85 ml). The brown slurry was treated with choline

hydroxide (2.68 ml, 2.2 eq) (supplied as a 45% wt solution in methanol) at ambient

10 temperature to form a deep purple solution which was stirred for 30 mins. The solution was filtered, and rinsed through with ethanol (4 ml). Triflouroacetic acid (0.36 ml, 1eq) in water (1.85 ml) was added to the filtrate to form an orange-red slurry which was then heated to 78°C (reflux) and stirred for 30 mins. The reaction was then cooled to 60°C and treated with ethanol (25 ml, 12.5 vol) and stirred for a

15 further 1 h at 60°C. The suspension was then cooled to ambient and stirred for 17 h. After filtration the cake was washed with ethanol (8ml, 4 vol). The resulting solid was dried at 50°C *in vacuo* to give 2-(3,4-dimethylphenyl)-4-{[2-hydroxy-3'-(1H-tetrazol-5-yl)biphenyl-3-yl]-hydrazone}-5-methyl-2,4-dihydropyrazol-3-one choline as an orange solid (2.02g, 83%).

20

Proton NMR and IR data are consistent with the title compound.

EXAMPLE 3

## Tablet Composition

25 Lactose, microcrystalline cellulose, sodium starch glycolate, magnesium stearate and 2-(3,4-dimethylphenyl)-4-{[2-hydroxy-3'-(1H-tetrazol-5-yl)biphenyl-3-yl]-hydrazone}-5-methyl-2,4-dihydropyrazol-3-one choline are blended in the proportions shown in Table 1 below. The blend is then compressed into tablets.

Table 1

INGREDIENT	mg.
2-(3,4-dimethylphenyl)-4-[(2-hydroxy-3'- (1H-tetrazol-5-yl)biphenyl-3-yl]- hydrazone}-5-methyl-2,4- dihdropyrazol-3-one choline	8.45
microcrystalline cellulose	112
lactose	70
sodium starch glycolate	8
magnesium stearate	2

EXAMPLE 4

## Injectable Parenteral Composition

An injectable form for administering 2-(3,4-dimethylphenyl)-4-[(2-hydroxy-3'-  
5 (1H-tetrazol-5-yl)biphenyl-3-yl]-hydrazone}-5-methyl-2,4-dihdropyrazol-3-one  
choline is produced by stirring 5.0 mg. of the compound in 1.0 ml. of normal saline.

While the preferred embodiments of the invention are illustrated by the  
above, it is to be understood that the invention is not limited to the precise  
10 instructions herein disclosed and that the right to all modifications coming within the  
scope of the following claims is reserved.
